## Contents

- Introduction

- What is Nanobiotechnology?

- Nanofabrications

- MEMS/ NEMS, AFM, SAM, Soft lithography, ...

- Nanobiotechnology Applications

- Nanomedicine, Nanobiosensor (biochip), Nano Fluidics (LOC, Biofluidic devices)
- Molecular Self-Assembly, Intelligent Drug Delivery Systems (DDS), Nanomachine, Other Nano-Bio Devices & Systems

- Summary

KAIST Department of BioSystems

NanoBiotech Laboratory

## Focus on Nanobiotechnology

This issue looks at some of the emerging life science applications of nanotechnology and nanoscience, a field that has been loosely termed nanobiotechnology. Nanobiotechnology integrates the design of new materials and devices with the exquisite specificity of biological molecules, enzymes and cells. Applications include new types of biomaterials, sensors relying on conformational changes in biomolecules, molecules for use in imaging and tagging macromolecules and cells, and devices, materials and particles for use in drug delivery or directly as therapeutics.

## news feature

### The tiny toolkit

Can we probe the workings of cells without destroying them? Yes, says an influential and interdisciplinary group of US researchers — the answer lies in nanotechnology. Catherine Zandonella reports.

Nature 423: 10-12 (2003)

## Definition and Scope of Nanotechnology

- Science for exploring the materials and phenomena in the nanometer (atomic, molecular) scale
- Technology for manipulating and controlling the structure and components in the nanometer scale, thus inventing new materials, devices and systems

KAIST Department of BioSystems

NanoBiotech Laboratory

## What is Nanobiotechnology?

©2004 Je-Kyun Park, Ph.D.

## Nanobiotechnology

- Nanobiotechnology is the application of nanotechnology to the life sciences. This research field includes two approaches. One is **the application of nano-scaled tools to biological systems** and the other is **the use of biological systems as templates** in the development of novel nano-scaled products.

- Nanobiotechnology is the intersection of inorganic and organic engineering to solve critical problems in biology. These problems can be the creation of **new drugs, drug delivery vehicles, diagnostics, sensors, assays, tools such as fluidics, and manufacturing processes for all of the above.**

(Source) Ian J. Mehr, "Nanobiotechnology, Commercial Opportunities from Innovative Concepts," D&MD Reports #9072 (2002. 4)

- A continuum of opportunity for nanotechnology in the life sciences Nature Biotechnology 21: 1137-1143 (2003)

## Why Nanobiotechnology?

- Mother Nature did it first. Nature has built nanomachines for millennia.**
  - Nature applies nanotechnology daily to grow the multifunctional cells and tissues of plants and animals from a single biological cell
  - A cell is a warehouse of nanoscale machines.

- Biology can teach the physical world of electronics, computing, materials science and manufacturing**
  - There exist biomolecular analogues of conventional functional devices

## An Animal's Senses Guide Its Movements

- Nostrils** on each side of the head of the salmon allow water to flow into one and out the other
  - Sensory cells in the nostrils detect specific chemicals in the water
  - These cells aid the salmon in its homing ability
- Salmon have a **lateral line system**, seen here as a blue line along the sides of the fish
  - This enables the salmon to sense the direction and velocity of water currents and thus distinguish which direction is upstream

## Capillary-force Actuators

- Surface tension and capillary forces can be controlled actively or passively using different effects: **electrocapillary, thermocapillary, and passive capillary.**

### Electrocapillary Effect (known as Electrowetting)

Changes the surface tension between two immiscible, conductive liquids or between a solid surface and a liquid by varying their potential difference.

## Machines & Molecular Machines

Machines	Molecular machines
Vehicles	Hemoglobin
Assembly lines	Ribosomes
Motors, generators	ATP synthases
Train tracks	Actin filament network
Train controlling center	Centrosome
Digital databases	Nucleosomes
Copy machines	Polymerases
Chain couplers	Ligases
Bulldozer, destroyer	Proteases, proteasomes
Mail-sorting machines	Protein sorting mechanisms
Electric fences	Membranes
Gates, keys, passes	Ion channels
Internet nodes	Neuron synapses

## Nanotechnology Impacts on Biology

- Nanotechnology also offers researchers the chance to detect rare events or molecules that are present only at low concentrations.
- As nanotechnology brings more tools to the biologist's bench, the divisions between the fields of science will begin to break down.
- "The combination of microfluidics and nanotechnology will transform how biologists do everything."**

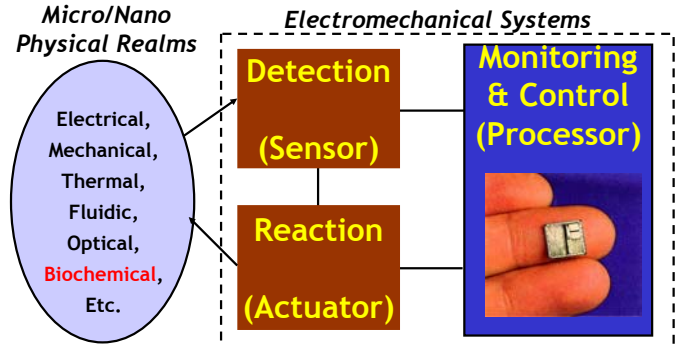

# Nanofabrications

*MEMS/ NEMS  
Self-Assembly  
Dip-Pen Nanolithography  
Soft-Lithography  
PDMS Molding  
Nanoparticles, Nanowires, Nanotubes*

©2004 Je-Kyun Park, Ph.D.

## Electro Mechanical Systems

KAIST Department of BioSystems

NanoBiotech Laboratory

## What is MEMS/ NEMS?

- Integrated micro devices or systems combining electrical and mechanical components fabricated using integrated circuit (IC) compatible batch-processing techniques and range in size from micrometers to millimeters

*In US: MEMS, Micromachining  
In Europe: Micro Systems Technology (MST)  
In Japan: Micromachines, MicroRobots*

- Miniaturization of non-electrical (optical-thermofluidic- biochemical) components

**MEMS: Micro Electro Mechanical Systems**  
**NEMS: Nano Electro Mechanical Systems**

KAIST Department of BioSystems

NanoBiotech Laboratory

## What is BioMEMS/NEMS?

- A Paradim Shift in the Making  
*"MEMS become BioMEMS" (BioPhotonics 2000.6)*
- Implementation of MEMS/NEMS to Bio-related areas  
(Bio Micro/Nano Electro Mechanical Systems)
- Needs
  - Lower chip cost (*Glass or plastic chips*)
  - Reduction of expensive reagents & test compound used
  - Integration of multiple functions onto a single chip  
(*Micro total analysis system (μ-TAS), Lab-on-a-chip*)
  - Point-of-care (POC) diagnostics (*Easy sample preparation*)
  - High throughput (*Microfluidic HTS disposables*)

KAIST Department of BioSystems

NanoBiotech Laboratory

## Biotechnological & Biomedical Microsystems

- Tools for Chemistry, Molecular Biology and Biochemistry
  - Sample preparation, Molecular separation
  - Small-scale organic synthesis
  - Amplification of nucleic acids/ Sequences
- Tools for Cell Biology
  - Cell mechanics & dynamics, Cell culture devices
  - Dielectrophoresis, Flow cytometry, Cell sorting
- Tools for Medicine, Biomedical Devices
  - Minimally invasive surgery
  - Neural prosthesis
  - Implantable devices, DDS
- Miniaturized analytical systems
  - Genomics and proteomics
  - Clinical analysis, Environmental testing, and Warfare defense
  - High throughput screening

KAIST Department of BioSystems

NanoBiotech Laboratory

## Self-Assembly

KAIST Department of BioSystems

NanoBiotech Laboratory

## Dip-Pen Nanolithography

KAIST Department of BioSystems

NanoBiotech Laboratory

## Soft lithography

- Self-Assembled Monolayers (SAMs)
- Contact Printing, Replica Molding, and Embossing
- Elastomeric Stamps and Molds
- Masters and Rapid Prototyping

Poly(dimethylsiloxane), PDMS

### MICROCONTACT PRINTING

1 The PDMS stamp is inked with a solution consisting of organic molecules called thiols and then pressed against a thin film of gold on a silicon plate.

2 The thiols form a self-assembled monolayer on the gold surface that reproduces the stamp's pattern; features in the pattern are as small as 50 nanometers.

NanoBiotech Laboratory

## Nanobiotechnology Applications

### Nanomedicine

- Nanobiosensor (biochip)
- Nano Fluidics (LOC, Biofluidic devices)
- Molecular Self-Assembly
- Intelligent Drug Delivery Systems (DDS)
- Nanomachine
- Other Nano-Bio Devices & Systems

©2004 Je-Kyun Park, Ph.D.

The National Nanotechnology Initiative includes among its goals, or "grand challenges," a host of futuristic improvements in the detection, diagnosis and treatment of disease. Some are depicted here. The goals, many of which are far from being realized, also feature new aids for vision and hearing, rapid tests for detecting disease susceptibility and responses to drugs, and tiny devices able to find problems—such as incipient tumors, infections or heart problems—and to relay the information to an external receiver or fix them on the spot.

### GOAL: Improved Imaging

Improved or new contrast agents would detect problems at earlier, more treatable stages. They might, for instance, reveal tumors (red) only a few cells in size.

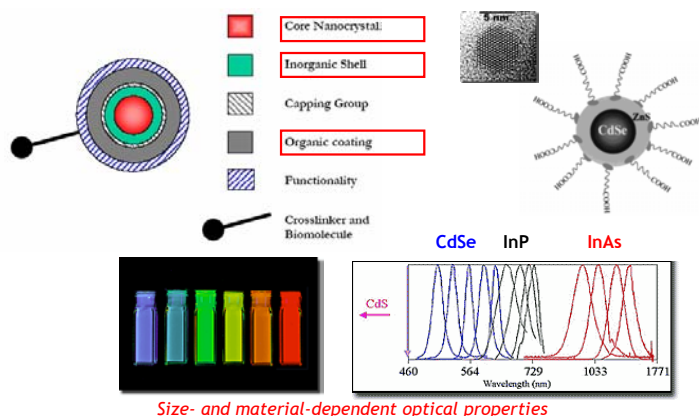

### GOAL: New Ways to Treat Disease

Nanometer-scale modifications of implant surfaces would improve implant durability and biocompatibility. For instance, an artificial hip coated with nanoparticles might bond to the surrounding bone more tightly than usual, thus avoiding loosening.

### A Grand Plan for Medicine

## Translating Biomolecular Recognition into Nanomechanics

Biological samples can be screened for the presence of particular genetic sequences using small beams (cantilevers) of the type employed in atomic force microscopes.

The surface of each cantilever is coated with DNA able to bind to one particular target sequence.

## In microchannels in which either width or height is less than $\sim 200\ \mu\text{m}$ ,

- Aqueous flow is generally laminar, not turbulent
- Diffusion is an efficient process for mixing the dissolved contents of two or more fluids
  - Diffusion-based Separation: H-Filter
- Particles can also be separated by diffusion according to their size

## Biomolecular Recognition of Semiconductor Quantum Dots and Magnetic Materials

### Peptide combinatorial approach

- Select peptides with high affinity for specific semiconductor structures and crystal orientations using molecular recognition
  - Phage display and bacterial display
- Rationally design peptides and polymers to assemble nanoparticles in 2D and 3D structures

## Conventional Patch Clamp vs. Microchip

## Future Visions

- Engineers of the future will have expertise in both biology and technology.
- Biology already has nanomachines.

Take lessons from Mother Nature

- Engineered biomolecular machines
- Nanomedical surgical implements
- Molecular healing and repair of injury and disease
- Smart drugs
- NEMS
- Mobile nanopharmacies, nanomachines, ...
